<sup>\*</sup>The test is not applicable since the EUT is not the device that is designed to be connected to the public utility(AC) power line.

### 5. Test results

### 5.1 Field strength of Fundamental

### 5.1.1 Regulation

According to §15.209(a),

Except as provided elsewhere in this Subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table: 83

|                  | Eigld Ctman ath    | Management Distance  |
|------------------|--------------------|----------------------|
| Frequency (MHz)  | Field Strength     | Measurement Distance |
| Trequency (WITE) | (microvolts/meter) | (meters)             |
| 0.009 - 0.490    | 2400/F(kHz)        | 300                  |
| 0.490 - 1.705    | 24000/F(kHz)       | 30                   |
| 1.705 - 30.0     | 30                 | 30                   |
| 30 - 88          | 100 **             | 3                    |
| 88 - 216         | 150**              | 3                    |
| 216 - 960        | 200**              | 3                    |
| Above 960        | 500                | 3                    |

<sup>\*\*</sup> Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this Section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz or 470-806 MHz. However, operation within these frequency bands is permitted under other sections of this Part, e.g., Sections 15.231 and 15.241..

#### According to §15.231(b)

In addition to the provisions of Section 15.205, the field strength of emissions from intentional radiators operated under this Section shall not exceed the following:

| Fundamental Fraguency       | Field Strength of  | Field Strength of Spurious |  |  |
|-----------------------------|--------------------|----------------------------|--|--|
| Fundamental Frequency (MHz) | Fundamental        | Emissions                  |  |  |
| (WITIZ)                     | (microvolts/meter) | (microvolts/meter)         |  |  |
| 40.66 - 40.70               | 2,250              | 225                        |  |  |
| 70 - 130                    | 1,250              | 125                        |  |  |
| 130 - 174                   | 1,250 to 3,750 **  | 125 to 375 **              |  |  |
| 174 - 260                   | 3,750              | 375                        |  |  |
| 260 - 470                   | 3,750 to 12,500 ** | 375 to 1,250 **            |  |  |
| Above 470                   | 12,500             | 1,250                      |  |  |

<sup>\*\*</sup> linear interpolations

Where F is the frequency in MHz, the formulas for calculating the maximum permitted fundamental field strengths are as follows: for the band 130-174 MHz,  $\mu$ V/m at 3 meters = 56.81818(F) - 6136.3636; for the band 260-470 MHz,  $\mu$ V/m at 3 meters = 41.6667(F) - 7083.3333. The maximum permitted unwanted emission level is 20 dB below the maximum permitted fundamental level.

### 5.1.2 Test procedure

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. During performing radiated emission below 1 %, the EUT was set 3 meters away from the interference receiving antenna, which was mounted on the top of a variable-height antenna tower. During performing radiated emission above 1 %, the EUT was set 3 meter away from the interference-receiving antenna.
- c. The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- f. If the emission level of the EUT in peak mode was 10 dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10 dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.
- g. It tested x,y and z 3 axis each, mentioned only worst case data at this report.

#### 5.1.2 Test Result

### -Complied

| Frequency<br>[MHz] | Receiver<br>Bandwidth<br>[kHz] | Detector        | Pol.<br>[V/H] | Reading<br>[dB(μV)] | Factor | Result<br>[dB(μV/m)] | Limit<br>[dB(μV/m)] | Margin<br>[dB] |
|--------------------|--------------------------------|-----------------|---------------|---------------------|--------|----------------------|---------------------|----------------|
| 433.92             | 120                            | Quasi –<br>Peak | V             | 86.3                | -8.3   | 78.0                 | 80.82               | 2.82           |

#### NOTE:

- 1. Limit =  $20\log(41.6667(F)-7083.3333) = 80.82$
- 2. Factor = Amp Gain + Attenuator + AF + CL

### 5.2 Spurious Emission

### 5.2.1 Regulation

According to §15.209(a),

Except as provided elsewhere in this Subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table: 83

| Frequency (MHz) | Field Strength (microvolts/meter) | Measurement Distance (meters) |
|-----------------|-----------------------------------|-------------------------------|
| 0.009 - 0.490   | 2400/F(kHz)                       | 300                           |
| 0.490 - 1.705   | 24000/F(kHz)                      | 30                            |
| 1.705 - 30.0    | 30                                | 30                            |
| 30 - 88         | 100 **                            | 3                             |
| 88 - 216        | 150**                             | 3                             |
| 216 - 960       | 200**                             | 3                             |
| Above 960       | 500                               | 3                             |

<sup>\*\*</sup> Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this Section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz or 470-806 MHz. However, operation within these frequency bands is permitted under other sections of this Part, e.g., Sections 15.231 and 15.241...

According to §15.231(b)

In addition to the provisions of Section 15.205, the field strength of emissions from intentional radiators operated under this Section shall not exceed the following:

| Fundamental Frequency (MHz) | Field Strength of Fundamental | Field Strength of Spurious Emissions |  |  |
|-----------------------------|-------------------------------|--------------------------------------|--|--|
| 40.66 - 40.70               | (microvolts/meter)<br>2,250   | (microvolts/meter) 225               |  |  |
| 70 - 130                    | 1,250                         | 125                                  |  |  |
| 130 - 174                   | 1,250 to 3,750 **             | 125 to 375 **                        |  |  |
| 174 - 260                   | 3,750                         | 375                                  |  |  |
| 260 - 470                   | 3,750 to 12,500 **            | 375 to 1,250 **                      |  |  |
| Above 470                   | 12,500                        | 1,250                                |  |  |

<sup>\*\*</sup> linear interpolations

Where F is the frequency in MHz, the formulas for calculating the maximum permitted fundamental field strengths are as follows: for the band 130-174 MHz,  $\mu V/m$  at 3 meters = 56.81818(F) - 6136.3636; for the band 260-470 MHz,  $\mu V/m$  at 3 meters = 41.6667(F) - 7083.3333. The maximum permitted unwanted emission level is 20 dB below the maximum permitted fundamental level.

#### 5.2.2 Measurement Procedure

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. During performing radiated emission below 1 %, the EUT was set 3 meters away from the interference receiving antenna, which was mounted on the top of a variable-height antenna tower. During performing radiated emission above 1 %, the EUT was set 3 meter away from the interference-receiving antenna.
- c. The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- f. If the emission level of the EUT in peak mode was 10 dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10 dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.
- g. It tested x,y and z 3 axis each, mentioned only worst case data at this report.

#### NOTE:

- 1. Factor(dB) = ANT Factor+ Amp Gain + Cable Loss
- 2. Margin (dB) = Limit Result [Result = Reading - Factor]

H = Horizontal, V = Vertical Polarization

ATT = Attenuation (10dB pad and/or Insertion Loss of HPF), AF/CL = Antenna Factor and Cable Loss

- \* The spurious emission at the frequency does not fall in the restricted bands.
- \*\* The measured result is within the test standard limit by a margin less than the measurement uncertainty; it is therefore not possible to state compliance based on the 95 % level of confidence. However, the result indicates that compliance is more probable than non-compliance.

All emissions not reported were more than 20 dB below the specified limit or in the noise floor.

### 5.3 Receiver Spurious Emission

### 5.3.1 Regulation

According to §15.209(a),

Except as provided elsewhere in this Subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table: 83

| Frequency (MHz) | Field Strength (microvolts/m at 3 meters) |  |  |
|-----------------|---|--|--|
| 30 – 88         | 100                                       |  |  |
| 88 – 216        | 150                                       |  |  |
| 216 -960        | 200                                       |  |  |
| Above 960       | 500                                       |  |  |

#### 5.3.2 Measurement Procedure

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- c. The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- f. If the emission level of the EUT in peak mode was 10 dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10 dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.
- g. It tested x,y and z 3 axis each, mentioned only worst case data at this report.

#### NOTE:

- **3.** Factor(dB) = ANT Factor+ Amp Gain + Cable Loss
- 4. Margin (dB) = Limit Result

[Result = Reading - Factor]

H = Horizontal, V = Vertical Polarization

ATT = Attenuation (10dB pad and/or Insertion Loss of HPF), AF/CL = Antenna Factor and Cable Loss

- \* The spurious emission at the frequency does not fall in the restricted bands.
- \*\* The measured result is within the test standard limit by a margin less than the measurement uncertainty; it is therefore not possible to state compliance based on the 95 % level of confidence. However, the result indicates that compliance is more probable than non-compliance.

All emissions not reported were more than 20 dB below the specified limit or in the noise floor.

# 5.4 Bandwidth of Operation Frequency

### 5.4.1 Regulation

The bandwidth of the emission shall be no wider than 0.25% of the center frequency for devices operating above 70 Mz and below 900 Mz. Bandwidth is determined at the points 20 dB down from the modulated carrier.

#### 5.4.2 Measurement Procedure

- 1. The transmitter output is connected to the spectrum analyzer.
- 2. The bandwidth of the fundamental frequencywas measured with the spectrum analyzer using RBW=10 kHz,VBW=10 kHz and Span=1 MHz.
- 3. The bandwidth of fundamental frequency was measured and recorded.

### 5.4.3 Test Result

# -complied

| Frequency<br>[MHz] | Bandwidth of the emission [kHz] | Limit [kHz] |  |
